

Contained platform work, delivered behind the scenes. You keep the client.

VXSec takes the Microsoft 365, Google Workspace, identity, migration, mail-flow, DNS, and OAuth/integration blocks that would otherwise pull your senior people off recurring client work. Every engagement is a defined block with a start, an end, and a documented handoff written for you to present.

WORK ACCEPTED

- Tenant assessment, cleanup, and contained migrations
- Access and offboarding review and remediation
- Admin recovery and role/permission cleanup
- Mail flow, mailbox, SPF/DKIM/DMARC, and domain changes
- OAuth, API, SSO, and SaaS integration failures
- Focused incident investigation and stabilization

RULES THAT PROTECT YOUR CLIENT RELATIONSHIP

- You own the relationship and control communications and approvals
- No upsell into your accounts, full stop
- Client information is used only for the scoped work
- Credentials move through your approved secure mechanism, never email or chat
- No client or partner name is reused publicly without written permission
- No indefinite helpdesk queue or 24/7 promise unless separately scoped

WHOLESALE PRICING

Quoted after scope, usually diagnostic-first so the estimate rests on evidence. You set your client price. Larger migrations and rescues are fixed-quoted after discovery with a deposit or milestone structure.

EVERY HANDOFF CONTAINS

- **Scope:** systems touched and the agreed outcome
- **Findings and evidence:** what was wrong, with proof
- **Changes performed:** every modification, recorded
- **Validation:** how the fix was tested and confirmed
- **Remaining risk and rollback notes**
- **Partner-ready client summary**, no pitch inside

HYPOTHETICAL EXAMPLE, STRUCTURE ONLY

Job: client mailboxes intermittently rejected by recipient domains after a domain change.

- **Scope:** one tenant, mail flow and DNS for two domains.
- **Findings:** SPF exceeded the lookup limit after the change; DKIM unsigned on the second domain.
- **Changes:** SPF flattened and consolidated; DKIM enabled and keys published; transport rule corrected.
- **Validation:** authentication passes on live test sends to three major providers, delivery confirmed.
- **Remaining risk:** third-party sender not yet aligned; rollback recorded for each DNS change.
- **Client summary:** one page, plain language, under your brand.
